

# Subagents

---

## Overview

In this section you will learn how to leverage subagents to parallelize tasks and speed up your Flappy Kiro game development workflow.

## Subagents

[Subagents](#)  allow Kiro to run multiple tasks in parallel or delegate specific tasks to specialized agents. Kiro automatically launches subagents when appropriate, but you can also manually trigger them with prompts like `Run subagents to....`

Kiro includes two built-in subagents:

- **Context gathering** - Explores projects and gathers relevant context.
- **General purpose** - Parallelizes all other tasks.

Subagents run in parallel, with the main agent waiting for all subagents to complete before proceeding. Results automatically return to the main agent upon completion.

Each subagent has its own context window, preventing pollution of the main agent's context.

 **Note**

Subagents do not have access to Specs, and Hooks will not trigger in subagents.

Subagents significantly speed up development by performing multiple tasks simultaneously. For example, you can analyze several game components, fetch multiple documentation sources, or review different code sections in parallel.

## Use subagents for parallel analysis

Ask Kiro to analyze multiple game components simultaneously.

Create a specialized code review subagent by adding a markdown file to `.kiro/agents` in your workspace.

## ► Example code-reviewer.md

This creates a `.kiro/agents/code-reviewer.md` file with custom instructions and tool access. You can then invoke it with `Use the code-reviewer subagent to find performance issues in my code` or via the `/code-reviewer` slash command.

parallel.

## ► Example prompts

# (Optional) Use subagents for testing

Ask Kiro to use subagents for parallel test execution and validation.

## ► Example prompts

# Test subagents

Experience how subagents accelerate your workflow.

1. Request parallel analysis → Multiple components reviewed simultaneously.
2. Use custom subagent → Specialized agent handles specific task.
3. Research documentation → Multiple sources fetched in parallel.

# Summary

You learned how to leverage subagents to parallelize tasks, create custom specialized agents, and significantly speed up your Flappy Kiro development workflow through concurrent execution.
