

Skills

Overview

In this section you will create and use a reusable Skill that packages instructions for a recurring Flappy Kiro task - scaffolding a new game entity class that follows your project conventions.

Skills

[Skills](#)  are portable instruction packages that bundle instructions, scripts, and templates into reusable packages that Kiro activates when they are relevant to your task. They are built on the open [Agent Skills standard](#) , so you can import skills from the community or other compatible AI tools, and share your own skills across your team.

Note

Steering and skills are complementary. [Steering](#)  gives Kiro persistent, always-available knowledge about your workspace. Skills are portable packages that load on-demand only when a task matches their description.

Skills load progressively, so they only consume context when needed:

- **Discovery** - At startup, Kiro reads only each skill's name and description.
- **Activation** - When a request matches a skill's description, Kiro loads the full instructions.
- **Execution** - Scripts and reference files load only as the task requires them.

You can store skills in two locations:

- **Workspace** - `.kiro/skills/` in your project, available only in that workspace. Ideal for project-specific workflows you want to share with your team.
- **Global** - `~/.kiro/skills/` in your home directory, available across all workspaces. Ideal for personal workflows. If names conflict, the workspace skill takes priority.

Skills are defined in a folder containing a required `SKILL.md` file, and can optionally include `scripts`, `references`, and `assets` subfolders.

Create a skill

Ask Kiro to create a skill that scaffolds a new game entity class following the conventions in your steering files

Kiro creates a `.kiro/skills/entity-scaffold/SKILL.md` file. The name must match

joelleemail2019 ▼

Tip

Kiro uses the skill description to decide when to activate the skill. By writing a precise description and including key words, Kiro will activate the skill at the correct time.

► Example SKILL.md

Use the skill

Kiro activates the skill automatically whenever a request matches its description. Ask Kiro to create a new entity and watch it apply the skill's instructions.

► Example prompts

You can also invoke a skill explicitly. Type `/` in the chat input to see your skills listed as slash commands, then select `/entity-scaffold` for direct control over when it runs.

(Optional) Import a Skill

Because skills follow the open Agent Skills standard, you can import them from GitHub or a local folder and use them immediately.

1. In the Kiro panel, open the **Agent Steering & Skills** section.
2. Choose **+** and select **kiro-introduction agent skills**.
3. Select a source:
 - **GitHub** - a public repository URL that points to the skill's subdirectory (not the repository root).

- **Local folder** - import a skill from your filesystem.

The imported skill is copied into your skills directory and can be used immediately.

Summary

You created a reusable skill that packages your conventions for scaffolding new Flappy Kiro entities, saw Kiro activate it automatically when a request matched its description, and learned how to invoke and import skills. Skills let you capture recurring workflows once and share them across your projects, your team, and other Agent Skills-compatible tools.
