

Generate steering files

Overview

In this section, you will create agent steering files to ensure consistent code patterns throughout your Flappy Kiro game development.

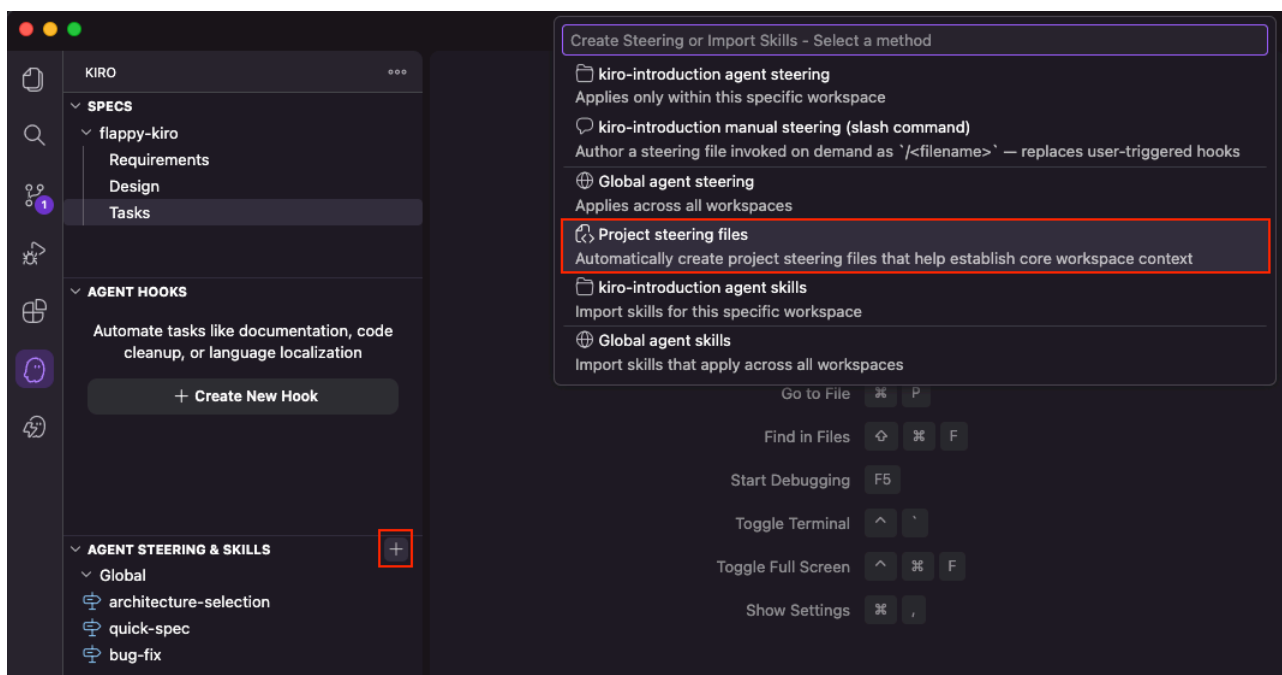

[Steering files](#)  are markdown files that provide additional context and instructions to Kiro across all or some of your interactions. They're useful for defining team standards, project-specific conventions, or helpful information about how to build, test, and work with your codebase — ensuring Kiro consistently follows your preferences without repeating yourself in every chat.

Steering files can apply at either a project or workspace scope.

Steering files support different inclusion modes: **always** (default), **fileMatch** (conditional on file patterns), **manual** (included via # in chat), and **auto** (included when the description matches the current task).

Foundational steering files

Kiro can generate steering files automatically using the + icon on the **Agent Steering & Skills** panel. Kiro will create three foundational steering files: `product.md` (product context), `tech.md` (tech stack and patterns), and `structure.md` (project layout). These give Kiro baseline knowledge about your project before you add any custom steering.

Custom steering files

Custom steering files can be created to target specific processes, scenarios or standards.

Create game coding standards

Create a steering file to specify coding standards to help Kiro have consistency of coding across the workspace.

1. In the chat panel, ask Kiro to create game development coding standards steering file.

► **Example prompts**

(Optional) Create additional custom steering files

1. Ask Kiro to create game mechanics and physics steering file.

► **Example prompts**

2. Ask Kiro to create visual and audio design steering files.

► **Example prompts**

3. Ask Kiro to create Flappy Kiro-specific domain steering files.

► **Example prompts**

Test steering files

1. Verify your steering files are working by creating game components.
2. Examine the created code to ensure it conforms with your requirements.

► **Example prompts**

Summary

You have created comprehensive steering files that automatically enforce consistent game development standards. These will guide all code generation to follow game architecture best practices, performance optimization patterns, and Flappy Kiro-specific domain logic for creating a polished arcade gaming experience.
